

Annotation

This bachelor thesis deals with procrastination and time management among college students. I focus specifically on five students from the Faculty of Social Sciences, five students from the Second Faculty of Medicine and five students from the Faculty of Law. All of the above mentioned faculties are part of Charles University in Prague. The aim of my work was to find out what procrastination and time management tell us about trends in contemporary society and how it is related to its transformation. The data was collected using semi-structured interviews and then analyzed using thematic analysis. The six categories that emerged showed that students most often procrastinate if they are not sure about the instruction of assignments, about their field of study or overall having clearly defined life goals. Students do not usually manage their time. Their day-to-day activities are based on clearly defined hours at work or at school. Additionally, communication technologies have a relevant impact on students' procrastination, especially Facebook and other social networks. Using the book *The Liquid Modernity* of Zygmunt Bauman I make findings in the context of social transformation as part of the transition from solid modernity to liquid modernity.
